The first step in experimental modal analysis is to measure the excitation and responses of the structure under test. The structure must be excited and the applied excitation force and resulting response vibrations, typically accelerations, are both measured resulting in a Frequency Response Function data set.

Modal Testing

Modal analysis is defined as the study of the dynamic characteristics of a mechanical structure. This applica-tion note emphasizes experimental modal techniques, specifically the method known as frequency response function testing. Other areas are treated in a general sense to intro-duce their elementary concepts and relationships to one another.
